

The Course Planner SQL Database will provide us with the course information and will receive updates by the HokieSPA class timetable. The view will be our JavaScript, HTML, and CSS files that make up the front end of the website and allow for user interaction. The controller will be made up of the Map Provider, our server back-end, and the HokieSpa class timetable. They will provide updates to our SQL Database and respond to events created by the website. Together, they make up the Model View Controller Architecture.
